

It suffices to prove that
there exists $(x, y) \ni$

$$\begin{cases} x^2 + (y-r)^2 \leq r^2 \\ y \leq |x|^p \end{cases} \quad \begin{matrix} (1 < p < 2) \\ r > 0 \end{matrix}$$

We can let (suppose $x, y < 1$) $y = |x|^q$, $p < q < 2$
and then $y \leq |x|^p$. For the first Inequality, it is

$$|x|^{2q} - 2|x|^q r + |x|^2 \leq 0. \text{ Since } q < 2,$$

for sufficiently small x , $r|x|^q \geq |x|^2 \geq |x|^{2q}$.
